Inverse CDF method

Suppose that we have a continuous random variable X having Cummulative Density Function (CDF) F_X. Then, the random variable

$$U = F_X(X)$$

has a Uniform distribution $U \sim U_{[0,1]}$. So to generate a random variate x from the distribution of X, we can use the following transformation

$$F_X^{-1}(U) = x$$

Weibull example

Example We want to generate a sample of $10,000$ random vairates from a Weibull distribution $W(5,2)$ using the Inverse CDF method.

If $X \sim W(\alpha, \beta)$ having PDF and CDF defined respectively as

$$\textbf{PDF} \qquad f_X(x) = \frac{\alpha}{\beta}\left(\frac{x}{\beta}\right)^{\alpha-1} exp\left(-\frac{x}{\beta}\right)^{\alpha} \mathbb{1}_{\mathbb{R}+}(x)$$

$$\textbf{CDF} \qquad F_X(x) = 1 - exp\left(-\frac{x}{\beta}\right)^{\alpha}$$

Weibull example solved

Then by the Inverse CDF, we can generate realizations of X by posing $U = F_X(x)$ and solving for x. We have

$$U = 1 - exp\Big(- \frac{x}{2}\Big)^5$$

$$1 - U = exp\Big(- \frac{x}{2}\Big)^5$$

$$-ln(1-U) = \Big(\frac{x}{2}\Big)^5$$

$$\big(- ln(1-U)\big)^{1/5} = \frac{x}{2}$$

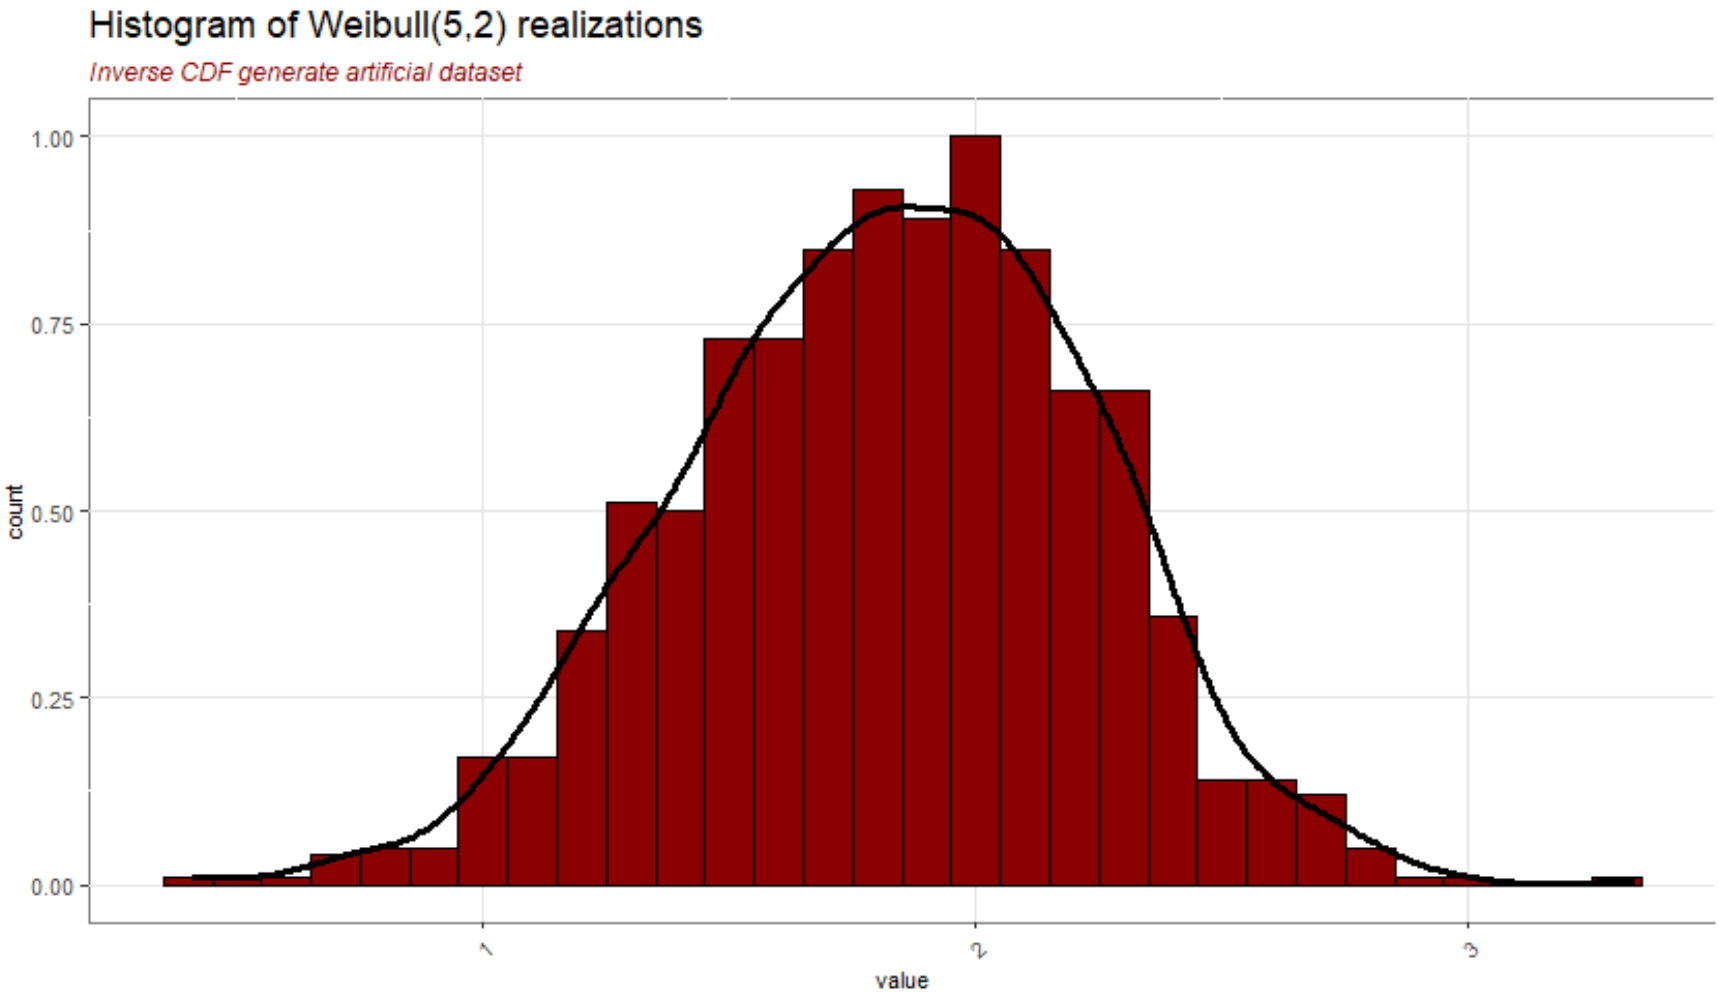
$$2\big(- ln(1-U)\big)^{1/5} = x$$

Code for Weibull realizations using the inverse CDF in R

```r
# Inverse CDF function
Inverse.CDF.Weibull <-function(n, alpha, beta) {
   u <- runif(n)                                  # generate uniform numbers
   data <- beta*((-log(1-u))^(1/alpha))           # formula derived
   return(data.frame(data))                       # return the data
}

# realizations and plot
set.seed(2023)
dataset <- Inverse.CDF.Weibull(n = 1000, alpha = 5, beta = 2)
head(dataset)
#       data
# 1 1.8226044
# 2 1.6719235
# 3 1.4157089
# 4 1.7441408
# 5 0.9975117
# 6 1.3275159
```

Histogram in R



Code for Weibull realizations using the inverse CDF in Python

```
# Inverse CDF function
def Inverse_CDF_Weibull(n, alpha, beta) :
        u = np.random.uniform(low=0.0, high=1.0, size=n)          # generate uniform numbers
        data = beta*((-np.log(1-u))**(1/alpha))                   # forumla derived

        return pd.DataFrame(data = data, columns = ['data'])      # return a data frame instead of an arry

# realizations and plot
np.random.seed(2023)
dataset = Inverse_CDF_Weibull(n = 1000, alpha = 5, beta = 2)
dataset
#     data
#0  1.655497
#1  2.343973
#2  1.952544
#3  1.340683
#4  1.372833
#...  ...
#995  2.069098
#996  2.056594
#997  1.996904
#998  2.001000
#999  1.925175
```
